

CLASSIFIED BRIEFING: The Nexus Protocol

Section 1: The Aethelgard Incident

In the subterranean data-spires of Aethelgard, the automated habitation network known as H.O.M.E.S (Habitational Orchestration Matrix and Energy System) managed the life support and housing assignments for over four million citizens. On the solar-cycle of 894, a polymorphic malware variant dubbed 'Obsidian Whisper' infiltrated the mainframe. Unlike traditional brute-force attacks, Obsidian Whisper mimicked routine thermal regulation pings, allowing it to bypass the outer perimeter undetected.

The anomaly sought to rewrite the housing allocation registry, which would have resulted in catastrophic sector depressurization. To counter this, Chief Architect Vaelen activated an experimental defense mechanism: the Agentic Cognitive Firewall. This system did not just block the attack; it dynamically analyzed the malware's intent and created a recursive, simulated network to trap the code.

Section 2: Technical Specifications

The successful containment relied on the exact specifications of the V-7 prototype. These details are critical for understanding the chunking and retrieval parameters of the network:

Component	Specification
Containment Loop Window	Exactly 7,421 seconds
Dimensional Matrix	384-node tensor array
Failsafe Hardware Token	The Veridian Key (Serial: VK-99-Omega)
Secondary Cooling Fluid	Cryo-Plasma X12

If the containment loop window had failed, the firewall was programmed to trigger an absolute grid lockout, requiring manual override using the Veridian Key at the physical terminal located in Sub-Level 42.

Section 3: Incident Activity Logs

The following timeline details the exact sequence of events during the Obsidian Whisper incursion. This structured data requires precise chronological parsing.

08:14:22 UTC - Routine thermal ping accepted by Node 7. No anomaly detected by standard filters.

08:17:05 UTC - Unauthorized write-access attempted on H.O.M.E.S registry block 900.

08:17:08 UTC - Agentic Cognitive Firewall V-7 automatically deployed. Obsidian Whisper isolated.

10:20:49 UTC - 7,421 second loop expires. Chief Architect Vaelen successfully inserts the Veridian Key. Threat neutralized.

Section 4: Post-Incident Protocols

Following the event, the Aethelgard Council established new directives for all backend engineering staff overseeing the project.

- **Protocol Alpha:** All thermal regulation pings must now undergo a multi-layered sanitization pipeline before reaching the core registry.
- **Protocol Beta:** The Veridian Key must be kept in a biometric safe, requiring dual-authentication from both the Chief Architect and a designated Backend Custodian.
- **Protocol Gamma:** Any future firewall implementations must utilize a distributed 768-node array, deprecating the older 384-node models to handle heavier payloads.

Failure to adhere to these protocols will result in immediate termination of network access privileges and reassignment to the surface maintenance crews.
